SECTION 1

Problem Statement

Every major Koinonia event ends the same way: thousands of people stepping out into the night, all needing to get home. For many attendees — especially visitors, women travelling alone, and members leaving late evening sessions — that moment is the **most uncertain part of the entire experience**. They must negotiate with drivers they do not know, at prices they cannot predict, with **no one accountable** if something goes wrong.

The irony is that the solution is often sitting in the same car park. **Verified, trustworthy members** with roadworthy vehicles and empty seats drive home in the same directions as those searching for rides. But there is no structure that connects them. **Goodwill exists in abundance; coordination does not**. Meanwhile, members who would gladly drive as a paid service — with proper vetting and **fair** earnings — have no ministry-endorsed way to do so, and that demand flows instead to outside ride-hailing platforms that know nothing of our community or its standards.

Attendees are also not all the same. Some simply want a **safe ride home** and are comfortable relying on the goodwill of fellow members. Others prefer the predictability of a **professional, paid service**. A single rigid model serves neither group well — which is why this brief proposes **two parallel tracks, launched together, under one shared standard of verification**.

Safety and trust of unverified transport

Attendees board vehicles driven by strangers whose identity, licence, and vehicle condition no one has checked. → Members and visitors carry **avoidable personal risk** on every trip, and one serious incident could damage trust in the ministry's events.

No coordination for members needing rides

There is no organised way for members to find rides to services, conventions, and special events — arrangements are ad hoc, word-of-mouth, or last minute. → Some members **attend less often, arrive late, or stay away** from evening sessions entirely because getting home is uncertain.

Cost burden on members

Individual rides on commercial platforms or with informal drivers are expensive, and surge periods after large events push prices higher precisely when members need transport most. → Transportation cost quietly becomes a **barrier to participation**, felt hardest by students, visitors, and lower-income members.

Spare seats going unused

Members drive to and from the same venues with three or four empty seats, while others nearby search for transport. → A **ready-made supply of safe rides is wasted** every single event, and the willingness to serve has no outlet.

No accountability when something goes wrong

If a dispute, harassment claim, overcharge, or accident occurs on an informal ride, there is no record of who drove, what was agreed, or where the trip went. → Victims have **no recourse**, the ministry has **no visibility**, and problems repeat because nothing is logged or reviewed.

Value leaking to outside platforms

Money members spend on transport flows to external ride-hailing companies, and members who want to earn by driving do so outside any community framework. → The community loses both an **income opportunity** for its own members and the ability to **set the safety standard** for its own people.

IN ONE SENTENCE

Our members face **unsafe, uncoordinated, and costly** transportation to and from ministry events, while the **trusted** drivers, spare seats, and goodwill that could solve it already exist within the community — **unconnected, unverified, and unaccountable**.

SECTION 2

Proposed Solution

We propose a **members-only transportation platform** in which every driver — without exception — is **verified by the ministry** before carrying a single passenger. Identity, driving documentation, and the vehicle itself are checked and **approved** by an administrator, so that "ministry-recommended transport" means something **concrete and consistent**.

The platform launches with **two parallel tracks operating side by side from day one**, under that one verification standard. **Track A (Volunteer)** is for **verified** members who give rides purely as an act of service: no fare is shown, no payment is collected, and no compensation of any kind changes hands. **Track B (Professional)** is for vetted members who drive as a paid service, with **transparent fares shown before booking** and proper records of every trip. Compensation status never lowers the bar — a volunteer passes the **same identity, background, and vehicle checks** as a paid driver.

Matching works around **real journeys** rather than rigid routes. A driver declares a destination; passengers heading the same direction are matched along that route, and the driver chooses whether to accept each request. For paid trips, passengers who are comfortable sharing can **split a flat-rate fare** — capped at three passengers so no one is ever crowded — while anyone who prefers a private trip can simply book one. **Sharing is always a choice, never a default.**

Above all, the platform is built so that **trust is earned continuously, not assumed once**. Every ride is **tracked live** from departure to arrival, every completed trip is **rated in both directions**, and administrators can see, log, and act on what happens across the network. **Verification opens the door; tracking and accountability keep the standard.**

The Seven Pillars of the Solution

1 · Verified Drivers

Every driver's identity, driving documents, and vehicle are **reviewed and physically checked** by an administrator before the account is activated — on both tracks, with **no exceptions**.

2 · Verified Passengers

Passengers register with **confirmed member identities**, so drivers also know who they are carrying. **Trust runs in both directions.**

3 · Mandatory Live Ride Tracking

Every ride, on every track, is **tracked in real time** from departure to arrival — visible to the passenger and shareable with a **trusted** contact or the ministry safety desk.

4 · Destination-Based Matching

The driver sets a destination; passengers are **matched to rides along that route**. Drivers accept or decline requests, avoiding rigid pre-defined drop-off points.

5 · Governed Shared Rides

Shared paid rides carry a **maximum of 3 passengers** — 1 in front, 2 in the back. **Flat-rate pricing is split equally** among passengers and stays consistent even when seats go unfilled.

6 · Volunteer Confirmation Flow

The platform stores each volunteer's ride details (vehicle, typical route, availability) and sends a **push notification to confirm or update them** before pickup — accurate records with minimal friction.

7 · Accountability

Two-way ratings after every completed ride, with repeat low ratings triggering review, and an **administrator dashboard** for oversight, incident logging, and dispute resolution.

SECTION 3

Methodology

Verification and Access

Every driver — volunteer or paid — must clear **every one** of the following verification standards before approval. No standard is waived on either track:

- **Identity verification** — confirmation of the applicant's full identity against valid government-issued ID and ministry membership records.
- **Background check** — security screening aligned with the registration and security-check protocols previously used by the ministry's security department.
- **Driver's licence check** — a valid, current driving licence of the correct class, **verified** against the issuing record.
- **Vehicle roadworthiness inspection** — a physical inspection of the vehicle's condition, safety features, seatbelts, and general fitness to carry passengers.
- **Insurance verification** — confirmation that valid, in-date vehicle insurance documentation exists and covers the vehicle presented.
- **Vehicle documentation review** — registration papers, roadworthiness certificate, and all other legally required vehicle documents checked for validity.
- **Physical inspection of driver and vehicle** — an in-person meeting in which an administrator confirms that the driver and vehicle match the submitted documents, and records the vehicle's **make, model, colour, and plate number**.
- **Track selection at onboarding** — Volunteer (**free**) or Professional (paid), with track switching subject to administrator approval.

Ride Matching and Coordination

- **Destination-based matching engine** pairing passengers to rides along the driver's declared route.
- Ride booking with **real-time availability**, filterable by track (Volunteer or Paid) and ride type (private or shared).
- Drivers retain the **choice to accept or decline** requests based on their intended route.

Safety and Tracking

- **Mandatory live trip tracking** on every ride, across both tracks and all ride types.
- In-app **emergency/SOS button** alerting administrators and sharing live location instantly.
- Driver **photo, name, vehicle details, colour, and plate number** shown to the passenger before boarding.

Pricing and Incentives

- **Transparent digital fare calculation** for Track B, shown before the ride is **confirmed**; Track A shows **no fare or payment prompt** at any point and carries no compensation of any kind.
- **Flat-rate shared-ride pricing split equally** among passengers, with per-passenger payment tracking visible to the driver.
- Ride pairing is **optional** — passengers choose at booking between a shared ride and a private trip.
- Shared-ride drivers receive a **base incentive uplift** to encourage participation in the shared model.

Accountability and Quality

- **Two-way ratings and feedback** after every trip, on both tracks, with repeat low ratings triggering review.
- **Volunteer recognition** — service hours logged and appreciation badges — to sustain participation.
- A **running record of bookings and confirmed payments** to protect against disputes over shared fares.

Administration and Governance

- **Administrator dashboard** for oversight, incident logging, and dispute resolution across both tracks.
- **Volunteer confirmation workflow**: stored ride details with push-notification prompts before each service.
- **Clear escalation path** from ratings and incident reports to administrative review.

SECTION 4

Expected Outcomes

Passengers — Safer journeys, verifiably

Every ride is with a **verified fellow member, tracked live** from departure to arrival — replacing uncertainty with a consistent, visible **safety standard**.

Passengers — Lower cost of participation

Free volunteer rides and equally split flat-rate shared fares **reduce what members spend** getting to services and events.

Drivers — A structured way to serve

Volunteers gain a simple, recognised outlet for service — spare seats become ministry, with **logged hours and appreciation badges**.

Drivers — Fair income for paid drivers

Vetted members on Track B **earn transparently**, with shared-ride incentives, an earnings dashboard, and receipts for every trip.

Community — Better event logistics

Coordinated departures and destination-based matching **disperse crowds faster and more calmly** after large sessions.

Community — Value kept within the body

Transport spending and earning **circulate among members** under one shared verification standard, instead of leaking to outside platforms.

A NOTE OF HONESTY

These are **expected** outcomes, not promises. Each should be **measured after launch** — through the metrics in Section 10 — rather than assumed in advance.

SECTION 5

Vision & Objectives

Our vision is a **trusted transportation network** in which any member of Koinonia Global can travel to and from ministry events **safely, affordably, and without anxiety** — carried by a **verified** fellow member, whether that member drives out of love as a volunteer or professionally for **fair** pay. Transportation should never be the reason someone misses a service, leaves early, or arrives home afraid; it should instead become one more place where the community's **trust, order, and generosity are visible**.

Objectives

- 01 Verify every driver and vehicle before activation.** No driver on either track carries a passenger until an administrator has **confirmed** identity, documents, and the physical vehicle.
- 02 Track every ride live, without exception.** Real-time tracking from departure to arrival is the non-negotiable foundation of passenger confidence.
- 03 Make volunteer service effortless.** Stored ride details and one-tap confirmation prompts let willing members serve without administrative burden.
- 04 Give paid drivers a fair, transparent livelihood.** Clear fares, automatic receipts, and an earnings dashboard make Track B honest work, honestly recorded.
- 05 Match rides around real journeys.** Destination-based matching pairs passengers to routes drivers are actually taking, respecting the driver's choice to accept or decline.
- 06 Keep shared rides comfortable and predictable.** A three-passenger cap and flat-rate equal splitting make sharing dignified, affordable, and **free** of fare disputes.
- 07 Preserve passenger agency.** Sharing a ride is always optional; a private trip is always available to those who prefer it.
- 08 Build accountability into every trip.** Two-way ratings, incident logging, and administrative review ensure problems surface early and are acted on.
- 09 Launch both tracks together and measure honestly.** Volunteer and professional service go live side by side under one verification standard, with every metric in Section 10 **tracked** from day one.

SECTION 6

Who This Serves

Three illustrative personas describe the people at the heart of the network. These are **working sketches** — they should be validated and refined through interviews with real members before design is finalised.

TRACK A · VERIFIED VOLUNTEER

Brother Emeka — The Volunteer Driver

Role	A long-standing member with a well-kept car who drives to every major service and usually leaves with empty seats.
Goals	To serve the body practically ; to help visitors and members get home safely after evening sessions; to give without any expectation of payment.
Frustrations	No organised way to find passengers going his direction; repeated form-filling puts him off informal schemes; worries about carrying strangers with no record of the trip.
Success looks like	He confirms his availability with one tap on a push notification, is matched with members along his route home, and sees his service hours and badges quietly accumulate.

MEMBER NEEDING RIDES TO SERVICES

Sister Grace — The Passenger

Role	A young professional and regular attendee without a car, who relies on commercial transport to reach services and events.
Goals	To attend freely — including evening sessions — without fearing the journey home or overspending on fares.
Frustrations	Unverified drivers and unpredictable prices after events; feeling unsafe travelling alone at night; skipping sessions when transport looks uncertain.
Success looks like	She books a ride with a verified member , sees the driver's photo, vehicle, colour, and plate before boarding, shares her live trip with her sister, and pays a fair split — or nothing at all on a volunteer ride.

VERIFIER & DISPATCHER

David — The Administrator

Role	A member of the ministry's operations/security team responsible for verifying drivers, monitoring rides, and resolving issues.
Goals	To keep one consistent safety standard across both tracks; to spot and resolve problems before they grow; to give leadership a truthful picture of how the network is performing.
Frustrations	Today there is nothing to oversee — no records, no visibility, no tools; complaints about informal rides arrive with no evidence to act on.
Success looks like	A single dashboard where he approves verified drivers, watches live rides, receives SOS alerts instantly , and reviews rating flags and incidents with a full trip record behind each one.

SECTION 7

How It Works

The driver experience differs by track, so the two journeys are presented **separately and in parallel**. Both begin at the **same verification gate** — the standard never changes; only what happens around payment does.

The Volunteer Driver's Journey (Track A)

Apply

Submit identity, licence, and vehicle documents through the app.

Hopeful, slightly formal

Get verified

An administrator reviews the documents and **physically inspects** driver and vehicle — the same checks as a paid driver.

Taken seriously

The Paid Driver's Journey (Track B)

Apply

Submit identity, licence, and vehicle documents through the app.

Hopeful, slightly formal

Get verified

An administrator reviews the documents and **physically inspects** driver and vehicle — the same checks as a volunteer.

Taken seriously

Choose the Volunteer track

Register as a **free, service-only driver** — no fares, no payment prompts, no compensation of any kind. Switchable later with approval.

In control

Confirm before service

A push notification asks the driver to **confirm or update stored ride details** (vehicle, route, availability) with one tap.

Ready, unburdened

Declare a destination

Set where you're heading; matched requests arrive from passengers along the route.

Purposeful

Accept & drive

Accept the requests that fit; every trip is **tracked live** from start to finish.

Trusted, protected

Complete & be recognised

Finish the trip, exchange **two-way ratings**, and watch **service hours and appreciation badges** accumulate.

Appreciated

Choose the Professional track

Register as a **vett ed paid driver** with **transparent**, platform-calculated fares. Switchable later with approval.

In control

Set availability

Go online for private or shared rides; shared trips carry the **3-passenger cap** and a **base incentive uplift**.

Ready to earn

Declare a destination

Set where you're heading; matched requests arrive with **fares calculated and shown up front**.

Purposeful

Accept & drive

Accept the requests that fit; every trip is **tracked live**, with per-passenger payment status visible on shared rides.

Trusted, protected

Complete & get paid

Finish the trip, exchange **two-way ratings**, and see **earnings, receipts, and trip history** recorded on the earnings dashboard.

Fairly rewarded

The Passenger's Journey

Register

Join with a **confirmed member identity**.

Welcomed

Request a ride

Choose track (Volunteer or Paid) and type (private or shared).

In control of the choice

Get matched

The platform pairs you with a **verified driver** heading your way; fares (Track B) are **shown before you confirm**.

Informed, no surprises

Confirm the match

See the driver's **photo, name, vehicle, and plate number** before boarding.

- The **vehicle's colour** is also displayed to the passenger before boarding, so the right car can be identified at a glance — even in a crowded, dark car park.

Reassured

Ride, tracked live

Follow the trip in **real time** and share it with a **trusted** contact; **SOS is one tap away**.

Safe, watched over

Pay your share

On paid shared rides, pay your **equal split** in-app with an automatic receipt; volunteer rides show **no payment at all**.

Fairly treated

Rate the trip

Leave a rating and feedback that feeds directly into **network quality**.

Heard

THE TRUST LOOP

Verification lets a driver in → the **confirmation flow** keeps their details current → **live tracking** makes every ride visible while it happens → **two-way ratings** record how it went → **administrators** review the record and act → which keeps verification meaningful. Each element reinforces the next; remove one, and the loop — and the trust — breaks.

SECTION 8

What the Platform Does Not Do

Honesty about limits is part of trust. Leadership and members should understand clearly what this platform is — and is not.

It does not hold or handle money

Track B payments move between passenger and driver through the payment channel; the platform **records, calculates, and receipts** fares but is not a bank, wallet, or escrow service.

It does not guarantee against human error

Verification, tracking, and ratings reduce risk substantially — they cannot eliminate it. The platform vets thoroughly and monitors continuously, but no system can promise perfection from every person on every trip; what it can promise is that **every trip is recorded, reviewable, and acted upon.**

It does not insure rides

The platform **checks that vehicle insurance documents exist and are valid**; it does not itself provide insurance cover for passengers, drivers, or vehicles.

It does not protect off-platform arrangements

Rides arranged privately outside the app — even between people who met through it — carry **no tracking, no records, and no platform accountability.**

It does not replace legal agreements

Terms of use, driver agreements, and liability notices are legal instruments in their own right; the platform **enforces process, not law.**

LEGAL NOTE (NOT LEGAL ADVICE)

Before launch, a **qualified lawyer should review** the platform's terms of use, driver and passenger liability notices, and the insurance questions raised above — including where responsibility sits in the event of an accident on a volunteer versus a paid ride.

SECTION 9

Launch Scope — Both Tracks Together

The platform launches with **Track A and Track B live simultaneously**, under one shared verification standard. Every driver on either track clears the **same checks**; every ride on either track is **tracked live** and **rated both ways**.

Track A — Volunteer Drivers · Free Rides

- ✓ **Full driver & vehicle verification** and physical inspection
- ✓ Volunteer availability, destination declaration, and route matching
- ✓ Stored ride details with **push-notification confirmation flow**
- ✓ **Mandatory live tracking**, SOS button, and driver identity display
- ✓ **Two-way ratings** and administrator dashboard
- ✓ Recognition system: **service hours and appreciation badges**
- ✓ **No fares, no payment prompts, no compensation** of any kind

Track B — Professional Paid Drivers

- ✓ Everything in Track A's **safety and verification standard**
- ✓ **Transparent fare calculation** shown before booking
- ✓ Secure in-app or transfer-based payment with **automatic receipts**
- ✓ Shared rides: **3-passenger cap**, flat-rate equal splitting, per-passenger payment status
- ✓ **Base incentive uplift** for shared-ride drivers
- ✓ Driver **earnings dashboard**: trips, fares, ratings
- ✓ Optional pairing — **private trips always available**

SECTION 10

How Success Will Be Measured

- **Adoption** — Registered drivers and passengers per track; rides requested and completed per event; growth month over month.
- **Verification integrity** — Share of active drivers with complete, current verification; time from application to approval; **zero unverified drivers carrying passengers**.
- **Ride completion** — Match rate for ride requests; completion rate of accepted rides; cancellation reasons.
- **Safety incidents** — SOS activations, reported incidents, and their resolution time; incidents per 100 rides, **tracked** separately for shared and private trips.
- **Ratings and quality** — Average two-way ratings; percentage of rides rated; low-rating flags raised and reviewed.
- **Retention** — Drivers still active after 90 days (especially volunteers); passengers taking repeat rides; track-switch requests.
- **Cost savings to members** — Estimated fare savings from volunteer rides and shared-ride splitting versus typical commercial fares for the same routes.

LEARNING FIRST

For the first 90 days, these are **learning measures, not targets**. They exist to show us honestly how the network behaves so leadership can set realistic targets **from evidence rather than optimism**.
